

Why one XY SPS chain sticks | L=4, beta=1.12, seed=22, N=32, chain 5

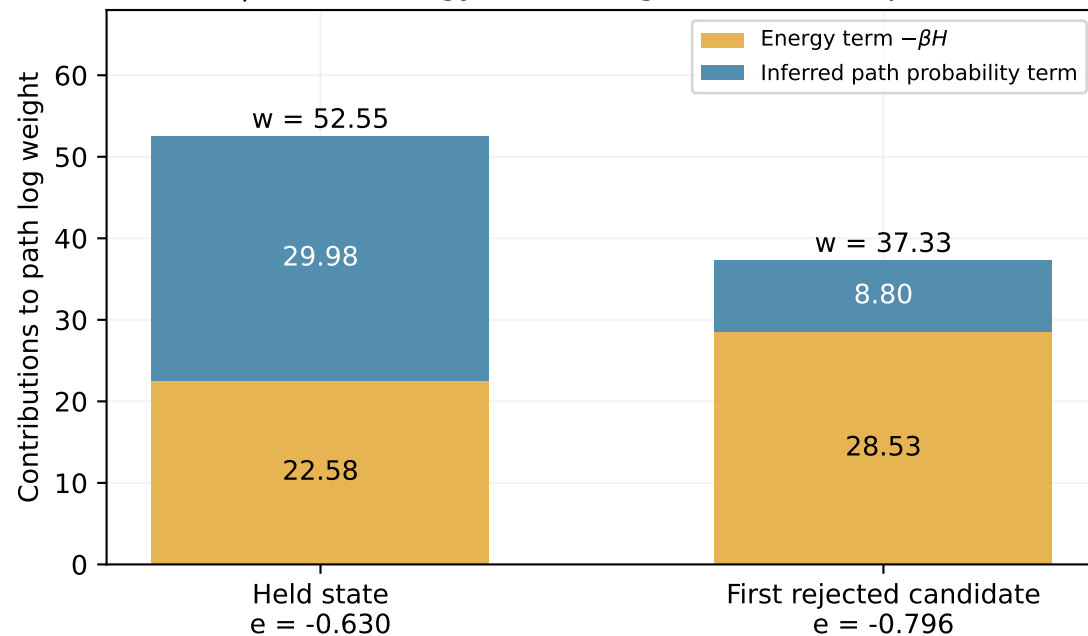

A | The recorded chain stops changing

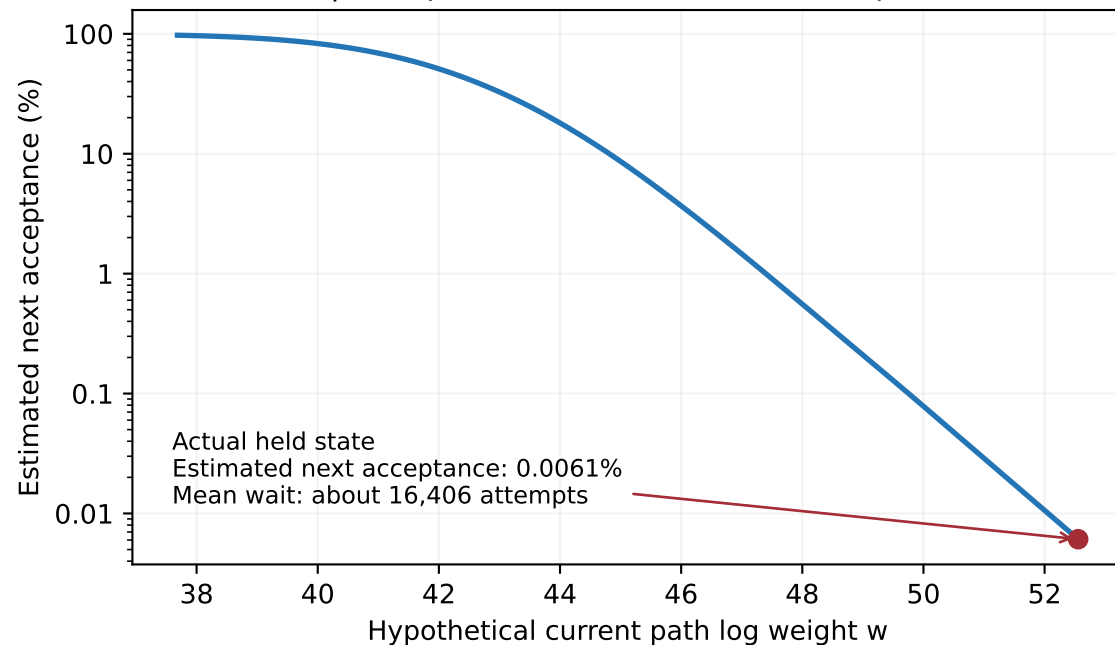

B | Candidates continue; their weights are lower

C | Lower energy does not guarantee acceptance

D | This particular state is hard to replace

A-B: recorded data. C: decomposition inferred from saved weights and endpoint energies.
D: finite candidate-bank estimate using the other seven chains; not a mixing proof. The stay continues at run end.
